

Fairbreeze water supply

Fairbreeze will not compete with Mtunzini town's drinking water supply as the mine will use raw river water supplied by Mhlathuze Water from the Mhlathuze River via a bulk water supply pipeline.

In effect, Fairbreeze will use the water currently allocated for Hillendale as part of the industrial water allocation for the area.

Fairbreeze infrastructure design at peak production can accommodate up to 48 800m³ of water per day. However, the actual average water abstraction from the pipeline will be approximately 37 000m³.

Recycling of water will be optimised within the operation to minimise the bulk water supply.
